X86 Data Centre Interconnect (DCI)

We are committed to provide highly reliable connectivity between your mission critical data centre infrastructure and value added services, enabling you to implement the right solution, cost-effectively.

X86 DCI service is designed based on highly reliable, incredibly robust, low-latency, self-healing next generation network utilizing coherent and DWDM technology.

It enables direct point to point connectivity between X86 DCI Point-of-Presence (PoP), allowing companies to connect between data centres, cloud service providers, peering exchanges, local & international carriers, and existing business providers, effectively building a robust interconnection platform. The service provides up to 100Gbps of connectivity to over 100 data centres across the globe.

Best of all, our customers enjoy rates and a variety of options that are extremely attractive, benefitting from an economy of scale that X86 enjoys by connecting to all domestic carriers and key international carriers at our PoP.

With our next-business day* service activation, we can readily scale up to cater to your needs as your business grows.
